

Fill the feed gap.

Sow *Interval* rape to provide a bulk of high quality feed to fill the gaps in your farming system.

Interval
Rape

***Interval* is a tall, fast establishing rape ideal for summer, autumn and winter feed. It offers high yield and quality feed for all stock types.**

Background.

Interval is a rape-kale cross, giving high yield with good regrowth ability.

Flexible sowing date.

Interval can be sown from spring through to early autumn to provide a bulk of high quality feed in around 90 - 110 days. Late spring sowings can be grazed in summer/early autumn then left to regrow for winter feed.

High yield.

Interval has performed well in trials - providing excellent DM yield.

Total DM yield of winter rapes (trial mean = 100%)*	
Variety	Total DM yield
<i>Interval</i>	126 a
<i>Goliath</i>	125 a
<i>Greenland</i>	118 a
<i>Winfred</i>	92 b
<i>Titan</i>	88 b
Trial mean (kg DM/ha)	5269

* Results from two trials in Canterbury during 2008 & 2009 (February sown). Statistical significance lettering given for 5% LSD level, varieties with the same letter are not significantly different.

Excellent winter utilisation.

Compared to kale, rape typically has higher feed quality, and is better utilised by stock.

Other characteristics.

Interval has excellent tolerance of dry conditions. It also has strong frost tolerance and resistance to powdery mildew.

Using <i>Interval</i> :										
Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug
Sow										
			Graze							
Maturity date: 90 - 110 days						Typical ME:		12 MJ/kg DM		
Typical yield: 5 - 8 t DM/ha (depends on sowing time & no. of grazings)						Sowing rate:		4 kg/ha
