

Kotare is a large leaved very high yielding white clover for dairy and beef grazing systems.

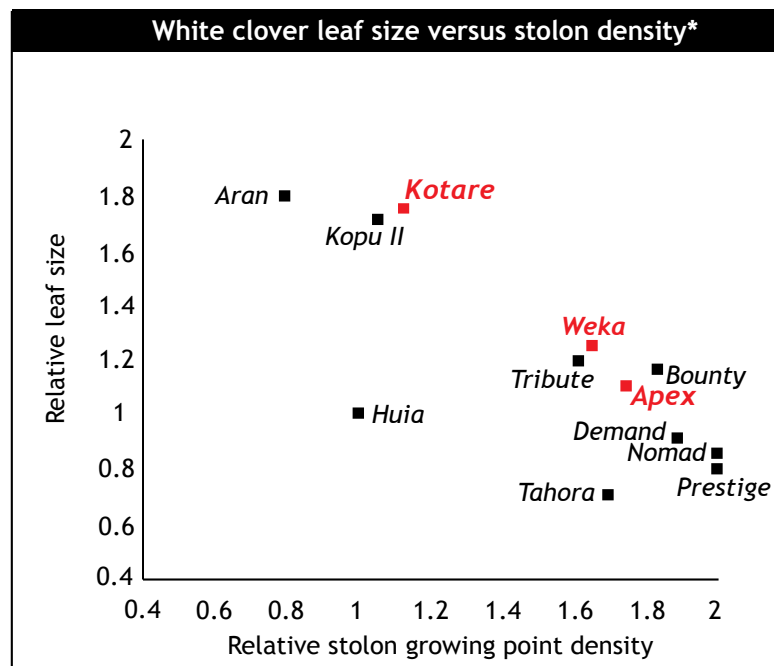

High yield

Kotare has shown very high total yields in trial, with excellent summer and autumn yielding ability.

Stolon density

The stolon growing point density of **Kotare** is high for a large leaved clover. More growing points gives clovers better recovery from damage caused by insects or pugging. When damaged, clover can regenerate from each growing point.

* Base data for graph produced by AgResearch. Kotare and Weka position estimated on six stolon growing point density and leaf size measurements by Agriseeds 2005-06.

Sowing Kotare

Dairy & Beef		kg/ha
Productive, persistent clover combination	Perennial ryegrass	20-30
	Kotare white clover	2
	Weka white clover	2
Total		24-34
